Drawing Cyclic And Geometric. It is known to attach a wire harness to a vehicle body by using tie rods. However, if the cross section of the wire harness is extremely large, the production cost becomes high. In particular, if the cross section of the wire harness is large, a braid section is largely curled. This makes it difficult to smoothly pass the wire harness through a predetermined passageway. In order to address this problem, in JP-A-2002-288017, a wire harness is compressed in a roll form at a braid section thereof. Exploring the role of individual maternal social support on maternal-infant attachment security in the transition to parenthood. Maternal attachment to the infant is a key factor in the child's capacity to develop healthy relationships. Little is known about the impact of individual social support on maternal attachment and its relationship to maternal distress, anxiety, and depression in the transition to parenthood. This study aimed to examine the role of individual and collective social support and anxiety and depression in predicting maternal attachment security. Women (N = 114) were recruited at the time of hospital birth and followed-up after 6 months postpartum. Hierarchical regression analyses were performed to assess the predictive role of social support and maternal and infant-related variables on maternal attachment security. The collective social support variable showed a significant positive effect on maternal attachment security, over and above the individual social support variable. Anxiety and depression were associated with lower levels of maternal attachment security, while postpartum maternal distress was not. This study provides support for a role of collective social support in maternal-infant attachment security in the transition to parenthood. Localization and characterization of an ecto-ATPase in the axoneme of a ciliated protozoan. A phosphorylated, 80-kDa, anion-exchange protein is present in the flagellum of the protozoan *Euplotes crassus*. It has an apparent molecular weight of 80,000. During polymerization of axonemal microtubules, the 80-kDa band dissociates. By immunofluorescence microscopy, the 80-kDa protein can be localized to the axoneme of both the anterior and posterior flagella. Purified axonemal microtubules also bind the antibody. This suggests that the protein is associated with the peripheral arm of the axoneme. A monoclonal antibody against the 80-kDa 82157476af
